**How healthy is the air
inside your home?**

Maybe you should know.

formaldehyde
bacteria
pet dander
pollen
carbon smoke
monoxide

For you, for your family,
for your health

Most Americans spend about
90% of their time indoors.

According to the U.S. EPA,
levels for many pollutants
may be two to five times
higher indoors than
outdoors.

Indoor air pollution can trigger asthma and allergies.

Indoor air pollution can trigger allergic reactions, asthma attacks, and other respiratory symptoms. Children, the elderly, and even healthy adults can experience fatigue, nausea, headaches, scratchy throat, and nasal irritation.

New homes are constructed with tighter windows and doors to save energy, but they also keep fresh air out. High efficiency heating and cooling systems constantly recirculate indoor air so indoor pollutants build up over time. Most homes may not be properly equipped to filter and purify indoor air.

Get the test. Know the facts.

So what is the air quality in your home? Now you can find out. The AirAdvice IAQ test pinpoints key indoor air quality problems that can affect you and your family's health, as well as their comfort and safety.

It's easy.

To perform the test, your HVAC professional places an AirAdvice IAQ monitor in your home for three days to measure air quality under real living conditions. AirAdvice's unique technology electronically analyzes the air 24 hours a day, recording a sample every minute. The monitor is virtually silent and makes no annoying noises.

You'll get more than numbers.

You'll receive a full-color AirAdvice IAQ report that enables you to "see" your home's daily air quality. You and your HVAC professional can then determine what may be affecting your home's indoor air and when those changes occur. The report also suggests ways to solve your air quality problems. Using the report, you and your HVAC professional can work together to select the right solution. And you can easily explain the results to the rest of your family.

Ask for an AirAdvice IAQ test today.
